Temporary deployment of scan- and detection systems

Bavak has a comprehensive range of scan- and detection systems which can be deployed at all kinds of events. The product range consists of X-ray inspection systems, walk-through metal detectors, handheld metal detectors, under vehicle inspection systems and drone detection systems.

X-ray machines can be used for inspections of luggage and parcels. Walk-through metal detectors are rented out at events and locations where visitors need to be screened for the presence of metal objects like guns and knives. The range also includes a ZBV®, the Z Backscatter Van. The ZBV can be used to scan vehicles, containers and trucks. With a drone detection system, it is possible to visualise drone activities in a specific area.

For more than 30 years, Bavak rents out these products to domestic- and worldwide organizers of sport events, high-risk events, governmental events and festivals. This experience provides us with extensive knowledge on how to secure events. Bavak can also train your operators on how to effectively use the equipment. This gives you only one reliable and professional point of contact for the rental of equipment for your event.

Bavak. Securing daily life.

X-ray equipment

X-ray machines are ideal to check objects for the presence of unwanted materials such as weapons and narcotics. X-ray machines are also regularly used to quickly find lost goods in a production process. Besides X-ray machines, Bavak can also provide a user-training to increase the efficiency and effectiveness of operators.

Metal Detectors

Effective access control includes checking for the presence of metal objects. This quick check can be carried out with a walk-through metal detector and/or hand-held metal detector. If a person is carrying an alarming metal object, a visual and/or audio signal may follow, after which one can be further checked.

Z Backscatter Van

Bavak has its own scan vehicle, the ZBV®, Z Backscatter Van. With the ZBV it is possible to scan aircrafts, cars, trailers and containers. By driving past an object, a scan is made in which especially organic materials, such as cigarettes, explosives and narcotics become clearly visible. This makes it easy to determine whether the content of an object requires further inspection.

Handheld MINI Z

The MINI Z is an easy to operate, compact handheld Z Backscatter system. This system is ideal for the detection of drugs and other prohibited items in objects like closets, car doors, abandoned bags and suitcases. The MINI Z weighs only 5 kg and provides quickly revealing scan images which are presented on a tablet.

Drone Detection Systems

Drone technology is developing at a rapid pace which increases its use. At the same time, drones can also be used for unwanted purposes like smuggling, privacy violations, terrorism or (corporate) espionage. To reveal the presence of drones in a specified airspace, a Bavak drone detection system can be deployed. If drone activity is detected, appropriate action can be deployed.
